

RecruitMe — Overview, How to Use It & Costs

What it is

RecruitMe is our in-house recruitment tool. It takes a job description and does the heavy lifting of sourcing: it searches across our **live JobAdder candidate base (~16,000 people)**, **LinkedIn**, and **SEEK** all at once, then uses **AI to score every candidate against that specific role** and hands back a ranked shortlist — each candidate with a short, plain-English explanation of why they fit (or don't).

In short, it turns *"here's a vacancy"* into *"here are your best-matched, ranked candidates, with reasons"* in minutes — and keeps the whole process (pipelines, notes, CVs, clients, and placements) in one place. Each team member has their own login.

How it works — step by step

1. **Create the job.** Click *New Job* and paste in the job description. The app's AI reads it and pulls out the must-haves, nice-to-haves, seniority, location, and salary automatically — no manual form-filling. You can adjust any of it afterwards.
2. **Find candidates.** Open the job and hit *Search*. It instantly returns matches from our **live JobAdder pool**, and — on demand — pulls **fresh results from LinkedIn and SEEK** as well. Everything lands in one candidate list for that job, and the same person showing up across sources is automatically merged into one record.
3. **Score them.** Click *Score all*. The AI rates each candidate **0–100** against the role's actual requirements, shows which must-haves they meet, and writes a short rationale — then ranks them best-first. Scoring only runs when you ask for it, so it only costs money when you choose to use it.
4. **Work the shortlist.** Move candidates through the pipeline — *Fetches* → *Scored* → *Shortlist* → *Contacted* → *Hired* — and keep everything on each candidate's record: notes, screening details, uploaded CVs, tags, and their LinkedIn / JobAdder / SEEK links and contact details (all editable in place).
5. **Pulse — catch people when they're actually looking.** This is the standout feature. You set up a "watch" — a saved search such as *"Java" AND ("Spring" OR "Spring Boot"), Wellington*. RecruitMe then re-checks SEEK on a schedule and alerts you the **moment someone matching updates their profile** — a strong early signal they're open to a move. It's like having someone watching the market for you around the clock; the updates stream into a live feed and the notifications bell, with the candidate linked.
6. **Clients & placements.** Track your client companies, submit candidates to them from inside a job, and log placements with fees, guarantee periods, and automatic follow-up reminders — so nothing slips through the cracks.

Everything runs in the browser — there's nothing to install, and it works from anywhere.

What makes it useful

- **One search, three sources.** Instead of checking JobAdder, LinkedIn, and SEEK separately, a single search covers all three — and de-duplicates the same person across them.
- **AI shortlisting with reasons.** You don't wade through 100 profiles; you read the top handful, each with a written reason — and you can trust the order because every candidate is scored against *this*

role's real requirements, not a generic keyword match.

- **Passive-candidate radar (Pulse).** Most of the strongest candidates aren't actively applying. Pulse surfaces them the instant they show a sign of moving — often before competitors notice.
- **Everything in one place.** Sourcing, scoring, notes, CVs, client submissions, and placements — no spreadsheets, no juggling separate tools.
- **Built for the team.** Each recruiter has their own login, and the admin view shows who's doing what (searches, scores, etc.), so activity and usage are visible at a glance.
- **Cost-controlled.** The only usage-based cost (the AI) is capped daily, so it can never run away — and most actions (browsing, searching the pool) cost nothing.

Costs

Spent so far (the app has been live ~2 months):

Item	Cost
Mini-PC (one-off — already purchased)	\$150
AI usage (Claude) to date	~\$26
Hosting (~2 months)	~\$50
Total so far	~\$230 (most of it the one-off mini-PC)

Ongoing, per month:

Item	Cost / month
Hosting (app + database)	\$25
AI (Claude) — scoring & parsing, hard-capped at \$5/day	~\$15–40
Mini-PC electricity	~\$3–6
Total	~\$45–75 / month

This is on top of the **SEEK, LinkedIn, and JobAdder subscriptions** we already pay for. The AI line is the only one that varies — it scales with how much scoring is done, and is capped so it can't run away. Everything else is essentially fixed.
